

# Machine Learning Optimization of Photometric Redshift

*Kate Sautel — Senior Talk 1*

*October 25, 2023*

# Overview

- Redshift
- Photometric redshift
- Machine learning
  - Neural networks
  - PyTorch
- My project

# Redshift

- ▶ Redshift/blueshift relevant in astrophysics and cosmology
- ▶ Describes relative motion of celestial objects
- ▶ Due to Doppler, wavelength of light emitted from moving object stretches (toward red side of electromagnetic spectrum)

# Cosmological Redshift

► Measure redshift  $\leftrightarrow$  distance from observer

► Hubble's law: speed  $\propto$  distance

►  $v = H_0 D$

► Redshift definition:

►  $1 + Z \stackrel{\text{def}}{=} \frac{f_{\text{emitted}}}{f_{\text{measured}}} = \frac{\lambda_{\text{measured}}}{\lambda_{\text{emitted}}}$

$Z = \text{redshift}$

# Photometric Redshift & Photometric Bands

- ▶ Photometry: measure intensity (flux) of light emitted by object viewed through different filters
- ▶ Photometer converts light into electric current through photoelectric effect

Redshift  
changes

Spectrum  
shift (in  $f$  or  $\lambda$ )

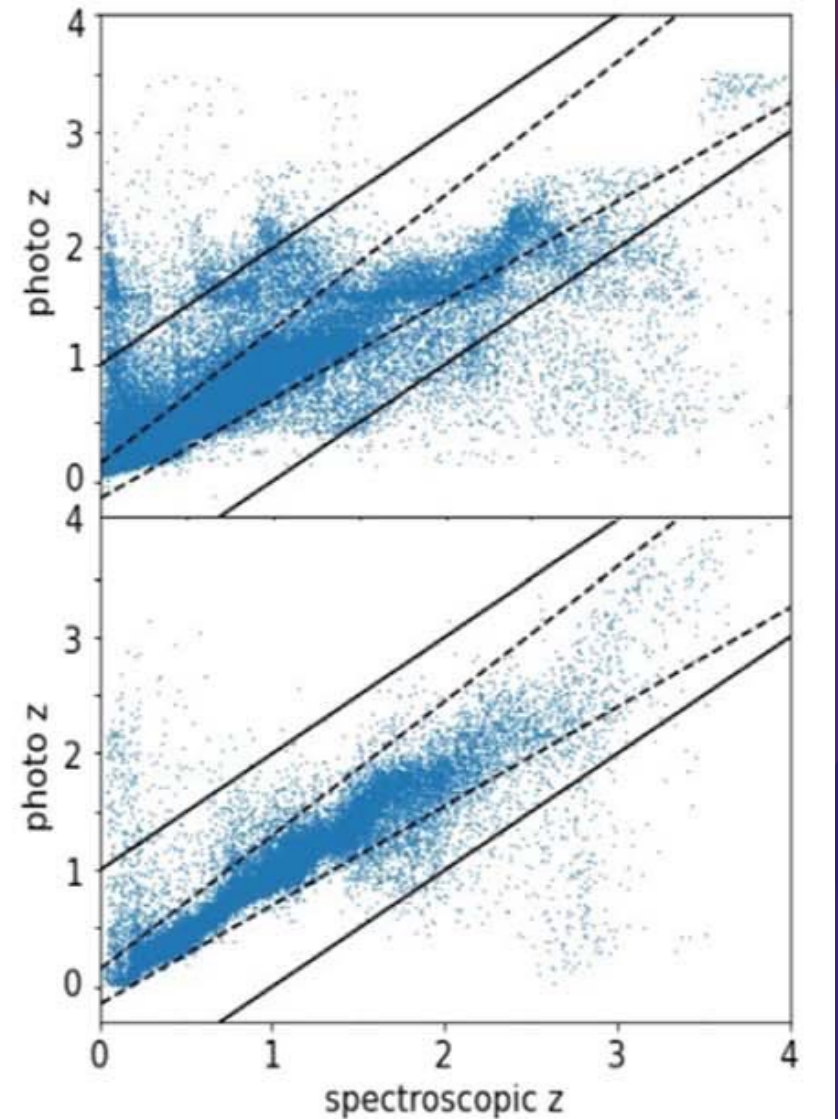

Flux in  
photo bands  
changes

# Photometric vs. Spectroscopic Redshift

- ▶ **Photometric:** estimation, determined through ML
  - ▶ Use known redshifts of galaxies to train/predict unknown redshifts, given parameters
- ▶ **Spectroscopic:** actual measurement of redshift
  - ▶ Observe frequency/wavelength of spectral lines
- ▶ Large-sky surveys (LSST: 100,000,000 + galaxies surveyed, ~500 petabytes of data)
  - ▶ Study galaxies statistically instead of for individual properties
  - ▶ Photometric > spectroscopic

# Accuracy of Photometric Redshifts

- ▶ Run tests with galaxies of known (spectroscopic) redshifts
- ▶ Classify estimations into 3 categories:
  - ▶ Non-outlier (NO)
  - ▶ Outlier
  - ▶ Catastrophic outlier (CO)
- ▶ NOT outliers in traditional/statistical sense
  - ▶ Specifically motivated by what would affect scientific analyses and conclusions

# COs and NOs

## ► Outlier:

$$O: \frac{|Z_{phot} - Z_{spec}|}{1 + Z_{spec}} > 0.15$$

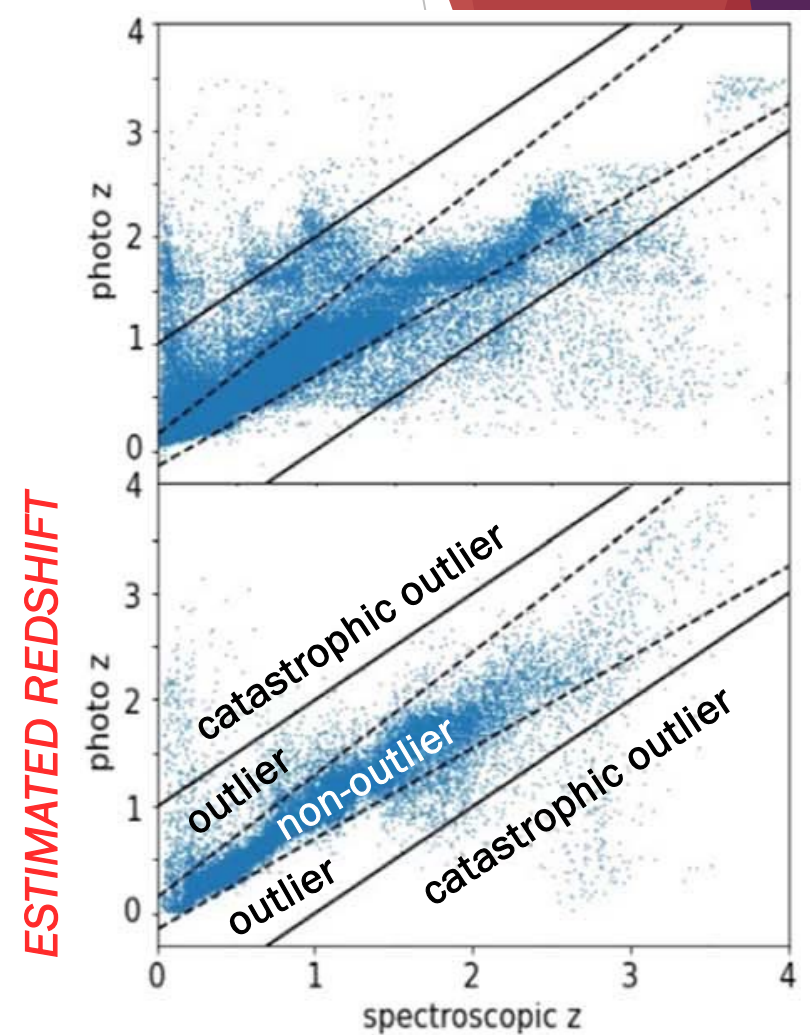

e.g. Hildebrandt, H. et al. 2010, A&A, 523, 832

## ► Catastrophic outlier:

$$O_c: |Z_{phot} - Z_{spec}| > 1.0$$

Bernstein, G. & Huterer, D. 2010, MNRAS, 401, 1399

$Z_{phot}$  = photometric redshift,  $Z_{spec}$  = spectroscopic redshift

# Intro to Machine Learning

- ▶ Use large quantities of data to train machine to make simple correlations
  - ▶ Avoid *explicitly* coding for individual circumstances
  - ▶ Handwriting
  - ▶ FaceID
- ▶ NNs are often backbone/structure
  - ▶ Most common

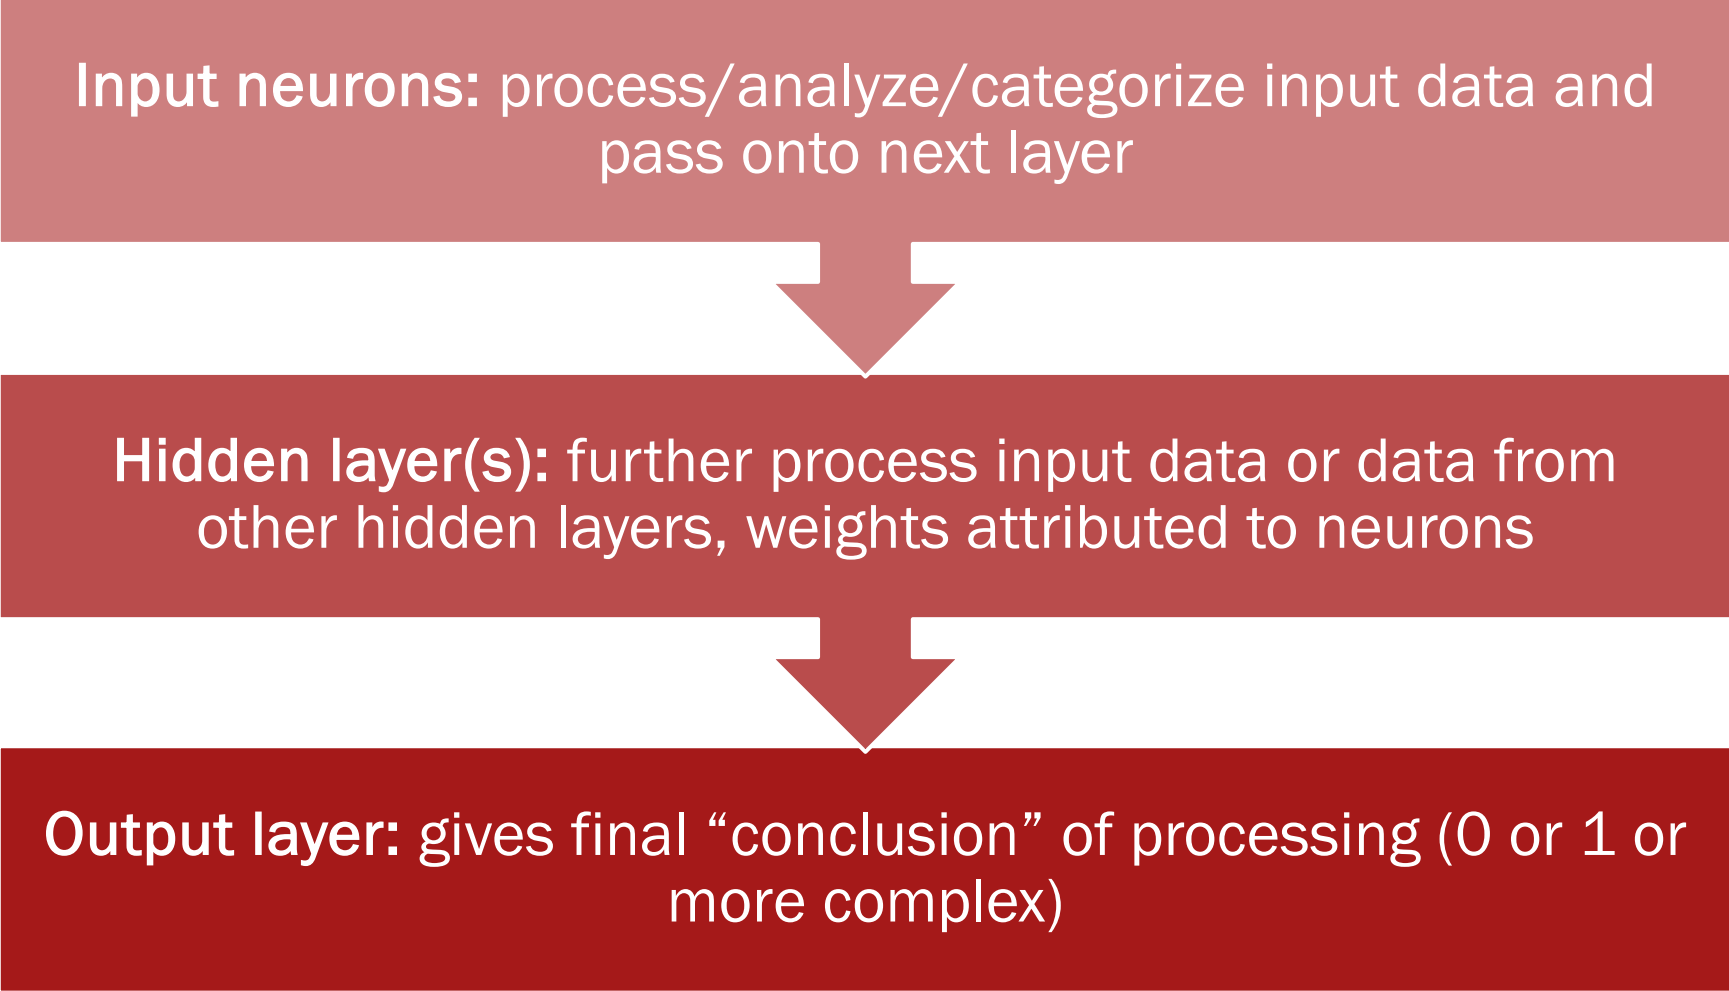

input layer

hidden layer 1

hidden layer 2

output layer

**Input neurons:** process/analyze/categorize input data and pass onto next layer

```
graph TD; A[Input neurons: process/analyze/categorize input data and pass onto next layer] --> B[Hidden layer(s): further process input data or data from other hidden layers, weights attributed to neurons]; B --> C[Output layer: gives final "conclusion" of processing (0 or 1 or more complex)];
```

**Hidden layer(s):** further process input data or data from other hidden layers, weights attributed to neurons

**Output layer:** gives final “conclusion” of processing (0 or 1 or more complex)

# Training

- ▶ Training involves updating the weights attributed with neurons in the hidden layers
- ▶ Weights updated iteratively
  - ▶ Updated automatically, given learning rate of model
  - ▶ Objective is to minimize loss function
  - ▶ Loss function: difference between expected output and actual output of model

# Broad NN Categories

- ▶ Feedforward NN
  - ▶ Unidirectional
  - ▶ Neurons can only transmit info to neurons in next layer
- ▶ Recurrent NN
  - ▶ Bidirectional
  - ▶ Neurons can transmit info to other neurons in the same layer
  - ▶ Complicated

# Data Dictionary

## HSC Data

- ▶ Both publicly available
- ▶ Both 5-band spectroscopic (actual) measurements

	A	B	C	D	E	F
1	u_mag	g_mag	r_mag	i_mag	zed_mag	z
2	25.426	25.567	25.2166	24.5832	24.0859	0.9966
3	26.0628	26.0293	25.419	25.1661	24.6804	1.8231
4	26.03	25.9201	24.8829	24.4989	24.438	0.5484
5	26.4852	26.0375	25.416	24.8233	24.2776	1.5998

## COSMOS2015 Data

- ▶ HSC: 286,401
- ▶ COSMOS: 58,619

	A	B	C	D	E	F
1	g_cmodel_mag	r_cmodel_mag	i_cmodel_mag	z_cmodel_mag	y_cmodel_mag	specz_redshift
2	20.9795723	19.9471302	19.0677147	18.58988	18.398716	0.548910022
3	21.9359283	20.2798767	19.2970181	18.8702316	18.6586075	0.548210025
4	18.2886353	17.6349106	17.292387	17.095787	16.9314461	0.069250003
5	22.0716896	20.4420376	19.3423538	18.947113	18.7577057	0.565800011

# Parameters & Hyperparameters

- ▶ Parameters: known inputs to input layers
  - ▶ Photo band magnitudes
- ▶ Hyperparameters: properties of the NN
  - ▶ Hidden layers
  - ▶ Neurons per layer
  - ▶ Loss metric:
    - ▶ SGD
    - ▶ Adam
    - ▶ AdGrad
  - ▶ Parameters of training procedure:
    - ▶ Momentum
    - ▶ Learning rate

# PyTorch

- ▶ Torch library in Python
- ▶ ML framework
  - ▶ Computer vision, NLP, training NN
- ▶ Analogous to TensorFlow
  - ▶ PyTorch → academia
  - ▶ TensorFlow → industry

Scalar

1

Vector

$\begin{bmatrix} 1 \\ 2 \end{bmatrix}$

Matrix

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$

Tensor

$\begin{bmatrix} \begin{bmatrix} 1 & 2 \end{bmatrix} & \begin{bmatrix} 3 & 2 \end{bmatrix} \\ \begin{bmatrix} 1 & 7 \end{bmatrix} & \begin{bmatrix} 5 & 4 \end{bmatrix} \end{bmatrix}$

# My Project

- ▶ Build NN redshift estimator in Python using PyTorch
- ▶ Optimize hyperparameters with Optuna
  - ▶ Limit number of COs
  - ▶ Apply RMS as a metric of error
- ▶ Hyperparameters: properties of NN
  - ▶ Hidden layers
  - ▶ Neurons per layer
  - ▶ Training procedure/code framework
    - ▶ SGD
    - ▶ Adam
    - ▶ Adgrad
  - ▶ Parameters of training procedure:
    - ▶ Momentum
    - ▶ Learning rate

# Optuna

- ▶ Hyperparameter optimization framework
- ▶ In PyTorch:
  - ▶ Wrap Optuna around model and let it learn
  - ▶ Will quickly and efficiently try new values of hyperparameters
  - ▶ Goal will be to find best combination of hyperparameters

# Optuna

- ▶ Potential framework:
  - ▶ Use 50% of galaxies as training set
  - ▶ Use other 50% as testing set
- ▶ Unsure about metric of success...
  - ▶ Limit number of COs
  - ▶ Apply RMS:

$$\text{RMS} = \sqrt{\frac{1}{n} \sum_{i=1}^n (Z_{phot\ i})^2 - (Z_{spec\ i})^2}$$
